Muscular dystrophy is a group of diseases that cause progressive weakness and loss of muscle mass. In muscular dystrophy, a person’s muscle cells are not replaced in a healthy way and damaged muscle cells are gradually replaced by fat and connective tissue. There are different types of muscular dystrophy, and the most common variety begin in childhood, mostly in boys. Other types don’t surface until adulthood. There’s no cure for muscular dystrophy.

Spinal muscular atrophy (SMA) - Better Health Channel

Muscular Dystrophy Australia Community Support Program enables people and families living with SMA to share their experiences and support each other. To share your journey visit: www.mda.org.au/sma

The Skeletal System. The skeletal system supports and protects the body. It gives you shape and helps you move. In addition, the bones make blood cells and store calcium and phosphorus. Functions of the Skeletal System: Support: The skeletal system provides a structure for the body. Protection: The bones of the skull protect the brain and the vertebrae protect the spinal cord. Movement: The bones provide a base for muscles to attach. Locomotion: The skeletal system allows you to walk, run, jump, and dance. The skeletal system is also involved in the maintenance of body posture. Other Functions: The skeletal system makes blood cells, stores calcium and phosphorus, and stores fat. The skeletal system also helps carry oxygen and other substances to and from the body.
